

Hello; This is what I would do / recommend.

Since you are trying to setup up the “Bridge” between two buildings, the setup would be similar to this below. (I added notes to show what I would do/recommend)

Switch on Amazon is \$15 , TP-Link TL-SG105

For Remote location can connect switch to **Receiver** for “wired” computers or other wired devices.

Or instead of switch use a Wifi router, either another mesh router device or standalone Wifi router like - TP-Link AC1200 (about \$40 on Amazon)
